

Machine Guard Safety

The purpose of this program is to train employers how to protect team members of their team from the hazards associated with moving machinery or equipment, and to comply with OSHA regulations.

Participants will be trained to identify and eliminate "point of operation exposure" for team members who perform work on, around or near machinery or equipment. Where exposures to "point of operation" hazards exist and are impractical or impossible to eliminate, participants will be trained and the company will be advised on additional countermeasures and safeguards that need to be implemented to protect their employees.

This program and its procedures are based on interpretations and requirements of OSHA's Subpart O machine guarding standard.
